One-Step Drug of Abuse Dip Card Test

One-Step Drug of Abuse Dip Card Test is an immunochromatographic assay for the qualitative detection of D-Amphetamine 1000, D-Amphetamine 500, Benzoylecgonine 300, Benzoylecgonine 150, 11-nor-Δ⁹-THC-9-COOH, Oxazepam, Methamphetamine 1000, Methamphetamine 500, Morphine 2000, Methadone, Phencyclidine, Oxycodone, Butalbital, Buprenorphine, Morphine 300, 2-Ethylidene-1,5-Dimethyl-3,3-Diphenylpyrrolidine. Methylenedioxymethamphetamine, and Nortriptyline in human urine at a cutoff concentration indicated in the table below.

The test may yield preliminary positive results when prescription drugs are ingested at prescribed doses. It is not intended to distinguish between prescription use and abuse of any drug. There are no uniformly recognized cutoff concentration levels for any drug in urine. The test provides only preliminary test results. A more specific alternative chemical method must be use in order to obtain a confirmed analytical result. Gas Chromatography/Mass Spectrometry (GC/MS) is the preferred confirmatory method. Clinical consideration and professional judgment should be exercised with any drug of abuse test result, particularly when the preliminary result is positive.

For in vitro diagnostic use only

WHAT IS ONE-STEP DRUG OF ABUSE DIP CARD TEST?

One-Step Drug of Abuse Dip Card Test is a rapid test for qualitative detection of D-Amphetamine 1000, D-Amphetamine 500, Benzoylecgonine 300, Benzoylecgonine 150, 11-nor-Δ^o-THC-9-COOH, Oxazepam, Methamphetamine 1000, Methamphetamine 500, Morphine 2000, Methadone, Phencyclidine, Oxycodone, Butalbital, Buprenorphine, Morphine 300, 2-Ethylidene-1,5-Dimethyl-3,3-Diphenylpyrrolidine, Methylenedioxymethamphetamine, and Nortriptyline in human urine. One-Step Drug of Abuse Dip Card Test yields a positive result when drug and/or its metabolite in urine is at or exceeds its cutoff concentration

PRINCIPLE

The One-Step Drug of Abuse Dip Card Test is an immunoassay. During testing, a urine specimen migrates upward on the test strip. A drug-positive urine specimen will not generate a colored line in the specific test line region of the strip, while a drug-negative urine specimen will generate a line in the test line region. A colored line will always appear at the control line region, indicating that proper volume of specimen has been added

WARNINGS AND PRECAUTIONS

- 1. For in vitro diagnostic use
- 2. For external use only.
- 3. For single use. Discard after first use.
- 4. Do not use the test if the pouch is punctured or not well sealed
- 5. Do not use after expiration date.
- 6. Keep out of the reach of children
- 7. The used test dip card and urine specimen should be discarded according to federal, state and local regulations

CONTENT OF THE PACKAGE

- Included in package - User Instruction
- Dip Card (inside foil pouch)

Not included in package - Watch, Timer or Clock

- Collection Cup

STORAGE AND STABILITY

Store as packaged in the sealed pouch at 39°F - 86°F (4°C - 30°C). The test is stable through the expiration date printed on the sealed pouch. The test dip card must remain in the sealed pouch until use Keep away from direct sunlight, moisture and heat. DO NOT FREEZE. Do not use beyond the expiration

WHEN TO COLLECT URINE FOR THE TEST?

You can use urine from any time of the day. The minimum detection time varies for different drugs. (Refer to the approximate detection timetable).

HOW TO COLLECT URINE?

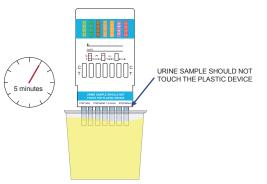

- 1. When you are ready to begin, remove the dip card from the sealed foil pouch.
- 2. Notice the colored tape on each strip indicates the name of the drug you are testing for.

3. Fill the collection cup with a fresh urine sample. Do not over-fill. (see the Max line mark).

HOW TO DO THE TEST?

- 1 Remove the cap from the dip card. Insert the exposed test strips into the urine sample for 10 to 15 seconds DO NOT let the urine sample touch the plastic device; this could cause inconclusive drug test
- 2. Insert the cap firmly back onto the dip card and lay it on a flat surface.
- 3. Wait for 5 minutes (start timing immediately after dip card is taken out of the urine sample) and read the results. DO NOT read results after 5 minutes.

Note: Results after 5 minutes may be not accurate and should not be read.

READING THE RESULTS

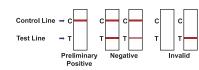

Preliminary Positive (+)

If a line appears in the C - Control area, but NO line appears in the T - Test area, then it indicates a Preliminary Positive result for the corresponding drug.

If a line appears in both the C - Control and T - Test area, then it indicates a Negative result for the corresponding drug regardless of how dark or how light the line may appear.

If at 5 minutes, NO line appears in the C - Control area, then the results are Invalid. In such case, retest with a new din card

Note: Each test strip needs to be looked at individually. Each line may vary in color and darkness or the rate at which the line appears. (DO NOT compare lines within the same test strip or between different test strips).

A positive test result does not always mean a person took illegal drugs and a negative test result does not always mean a person did not take illegal drugs. There are a number of factors that influence the reliability of drug tests. Certain drugs of abuse tests are more accurate than others.

IMPORTANT: The result you obtained is called preliminary for a reason. The sample must be tested by laboratory in order to determine if a drug of abuse is actually present.

WHAT IS A FALSE POSITIVE TEST?

The definition of a false positive test would be an instance where the test result from the One-Step Drug of Abuse Dip Card Test is positive, even though the initial target drug is not present in the sample. The most common causes of a false positive test are cross reactants. Certain foods and medicines, diet plan drugs and nutritional supplements may also cause a false positive test result with this product.

WHAT IS A FALSE NEGATIVE TEST?

The definition of a false negative test is that the initial target drug is present but isn't detected by **One-Step** Drug of Abuse Dip Card Test. If the sample is diluted, or if the sample is tainted or contaminated with a substance this could cause false negative results.

TEST LIMITATIONS

- 1. One-Step Drug of Abuse Dip Card Test provides only a qualitative, preliminary analytical result. A secondary analytical method must be used to obtain a confirmed result. Gas chromatography/mass spectrometry (GC/MS) is the preferred confirmatory method.
- 2. There is a possibility that interfering substances in the urine specimen may cause erroneous results
- 3. Substances, such as bleach and/or alum, in urine specimens may produce erroneous results.
- 4.A positive result does not indicate intoxication, the concentration of drug in the urine, or the route of drug administration.
- 5.A negative result may not necessarily indicate drug-free urine. Negative result can be obtained when drug is present but below the cutoff level of the test.
- Test does not distinguish between drugs of abuse and certain medications.
- 7. A positive test result may be obtained from certain foods or food supplements.

QUALITY CONTROL

If you work in a laboratory you should perform quality control testing and you should read this section. A procedural control is included in the test. A color line appearing in the control region (C) is considered an internal procedural control. It confirms sufficient specimen volume, adequate membrane wicking and correct procedural technique

Control standards are not supplied with this kit. However, it is recommended that positive and negative controls be tested as good laboratory practice to confirm the test procedure and to verify proper test performance. Quality control testing should be done with each new lot and each new shipment. It should be done every thirty days to check storage. Please contact our Technical Support at 1-626-443-8480 for controls that work with the dip card.

PERFORMANCE CHARACTERISTICS

Eighty clinical urine specimens were analyzed by GC/MS and by One-Step Drug of Abuse Dip Card Test. Each test was read by three viewers. Samples were divided by concentration into five categories: drug-free less than half the cutoff, near cutoff negative, near cutoff positive, and high positive. Results were as

Specificity and Cross Reactivity

To test the specificity of the test, the test device was used to D-Amphetamine 1000, D-Amphetamine 500, Benzoyleogonine 300, Benzoyleogonine 150, 11-nor-0²-THC-9-COOH, Oxazepam, Methamphetamine 1000, Methamphetamine 500, Morphine 2000, Methadone, Phencyclidine, Oxycodone, Butalbital, Buprenorphine, Morphine 300, 2-Ethylidene-1,5-Dimethyl-3,3-Diphenylpyrrolidine, Methylenedioxymethamphetamine, and Nortriptyline drug metabolites and other components of the same class that are likely to be present in urine. All the components were added to drug-free normal human urine. The following structurally related compounds produced positive results with the test when tested at levels equal to or greater than the concentrations listed below.

D-Amphetamine 1000	Result
(D-Amphetamine, Cutoff = 1,000ng/mL)	Positive at 1000ng/mL
L-Amphetamine	Positive at 100000ng/mL

EFFECT OF URINARY SPECIFIC GRAVITY
Urine samples of normal, high, and low specific gravity ranges (1.000 - 1.035) were spiked with drugs at 25% below and 25% above cut-off levels respectively. The One-Step Drug of Abuse Dip Card Test was tested using twelve drug-free urine and spiked urine samples. The results demonstrate that varying ranges of urinary specific gravity do not affect the test results.

EFFECT OF URINARY PH

The pH of an aliquot of negative urine pool was adjusted to pH ranges of 4.0 - 9.0 and spiked with drugs at 25% below and 25% above cut-off levels. The spiked, pH-adjusted urine was tested with *One-Step Drug of Abuse Dip Card Test*. The results demonstrate that varying ranges of pH do not interfere with the performance of the test.

LAY USER

LAY USER
A lay user study was performed at three intended user sites with 140 laypersons for each drug device. They
had diverse educational and professional backgrounds and ranged in age from 21 to >50. Urine samples
were prepared at the following concentrations; negative, +/-75%, +/-50%, +/-25% of the cutoff by spiking
drug(s) into drug free-pooled urine specimens. The concentrations of the samples were confirmed by
GC/MS. Each sample was aliquoted into individual containers and blind-labeled. Each participant was
provided with the package insert, 1 blind labeled sample and a device. The results are summarized below.
